

# *Integrated Safety Interlock System*

The interlocking spider and elevator in the Weatherford integrated safety interlock system prevent casing and tubing strings from being accidentally dropped. Two operating valves on the control panel sense the *open* and *closed* positions of the spider and elevator and prevent them from being opened at the same time. The system enables intelligent remote control of the spider and elevator from a safe position anywhere on the rig floor or from the driller's cabin.

## *Applications*

- Fully mechanized and semimechanized casing and tubing operations
- Conventional casing and tubing operations

## *Features, Advantages, and Benefits*

- Remote control by a single operator reduces the number of personnel required for tubular operations, which enhances safety.
- The versatile system is fully compatible with mechanized casing- and tubing-running systems and with the Weatherford Stabberless® system.
- The efficient, cost-saving system includes all necessary equipment and a control panel to retrofit existing spiders and elevators.
